

UX Research – Handling items inside Field Properties

Description: The document consists of research and analysis carried out for different types of ways to handle the Field properties section.

1. Making full Field Properties panel scrollable

Usage: Assume we do have more items/components present inside the Field Properties panel based on Form Fields. This might increase in vertical scroll with the increase in components present in the Field Properties panel.

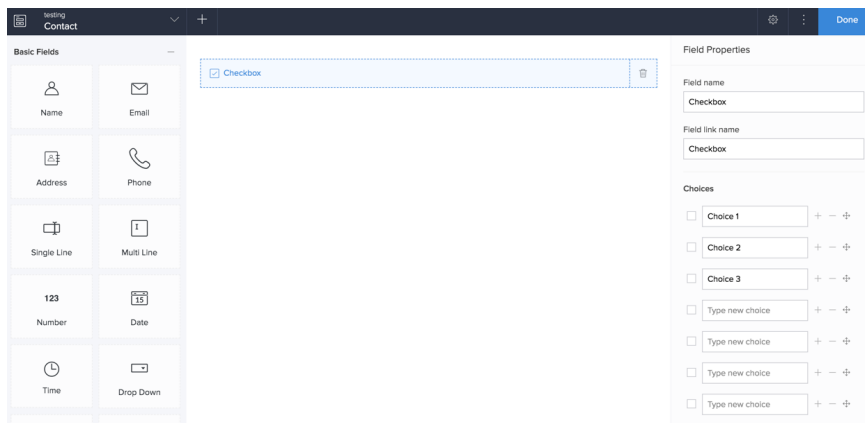

Based on research following website are using same approach to solve the problem in their applications:

SquareSpace: <https://www.squarespace.com/>

Scroll Usage: Squarespace is using a vertical scroll within their right panel, where most of the components are placed similar to our Field Properties panel.

Conclusion: They have kept the functionality like this, based on user addition of components. So, the user might be knowing that, increasing form fields unnecessarily will also increase scrolling for Field Properties as well. And this might be an avoidance to show an Internal Scroll within a full scrollable panel.

2. In form of Pop-Over

Usage: Pop-Over edit on selecting current Form Fields is not we are having as of now. But top website creator Wix uses this to edit their form fields.

Conclusion: We might not be working in this manner to edit our fields present in our main panel. But this is just for reference how top websites are creating forms.
